RAUM NETWORK

TOKEN ECONOMICS

Table of Contents

Introduction

The RN token is a native token of the Polygon blockchain and StarkNet ecosystem. The RN token's objective is to enhance the protocol, platform, and governance systems. Raum Network's RaumFi aims to become the dominant trading platform for the whole StrakNet network, providing liquidity for a wide range of swaps and transactions.

The RN token, as Raum Network's governance token, is a critical component of the platform's functionality.

- The RaumFi platform seeks to provide community members with revenue rights via the RN token. By holding and staking platform tokens on the platform, community members can get platform revenue generated by trading fees and other channels via RN tokens.

- The RaumFi platform aims to simplify the allocation of platform administration powers among community members who own RN tokens. Members may give beneficial suggestions and affect the platform's growth trajectory by staking tokens.

Value of Raum Network 'RN'

The RN token is the foundation of all trade and management on the RaumFi platform, and RN holders have the following rights:

- **_Platform Governance_**: By staking your tokens using RN blockchain-based smart contracts, you can govern the RaumFi platform and community.

- **_Platform Revenue_**: We will distribute approximately 40% of the platform revenue evenly among RN token holders. All you need to do is lock your RN on the RaumFi platform, and you can receive the corresponding platform revenue every 28 days without unlocking your tokens.

- **_Yield Farming_**: By locking your RN on the RaumFi platform, you can earn additional RN rewards when you unlock your tokens.

- **_Trading, Holding, and Circulation_**: Like other tokens, unlocked RN tokens can be traded, held, and circulated on the blockchain.

RN token Auto-Burn mechanism

The RaumFi platform will automatically spend a percentage of its platform earnings to purchase back RN tokens from the market and permanently destroy them.

The frequency and quantity of token burning may vary depending on established rules or community consensus. Some token burns may be triggered by particular events, such as a proportion of transaction fees earned, whilst others may be conducted on a regular basis or according to a predetermined timetable.

Token burning have the ability to reduce inflationary pressures, increase scarcity and token value, and perhaps attract investors looking for a deflationary asset. However, it is crucial to highlight that token burning does not ensure the token's success or value increase; it is one component of a larger ecosystem that must be complemented by substantial usefulness, acceptance, and community support.

Finally, the RN token burn mechanism is used to restrict token supply while possibly increasing token value over time. Raum Network intends to establish a climate that benefits token holders and incentivizes long-term token ownership by utilising this deflationary process.

RN Token Blueprint

The entire supply of RN tokens is limited to 500 million, guaranteeing that the total number of tokens in circulation never exceeds this level.

These tokens will be divided to community members, early-stage investors, IDO participants, liquidity providers, the founding team, and advisers in accordance with the different locking and vesting schemes outlined in the pie-chart and table on the Token Allocation & Vesting Period Section.
Following the launch of RaumFi on the StarkNet & Polygon mainnets, the protocol will produce the first batch of RN tokens through a sequence of token events:

- ***Introductory RN Liquidity Pool***: A modest amount of RN tokens will be assigned to the RaumFi 'RN/ETH' liquidity trading pool immediately upon the platform's mainnet activation. This limited supply of RN tokens will largely be utilised to decide token price during upcoming IDO events, as well as to allow community members to participate with the ecosystem and functionalities that rely on RN tokens (such as platform revenue acquisition and yield farming). The 'RN/ETH' pool will offer reference pricing for RN tokens in future IDO events.

- ***Introductory Liquidity Rewards Event***: Following the launch of the mainnet, RaumFi will run a one-month initial liquidity rewards event to motivate users to supply liquidity to the RaumFi. Users can receive RaumFi RN tokens by contributing liquidity to liquidity pools like as 'ETH/USDT', 'ETH/DAI', and 'DAI/USDT', among others. These RN tokens will be distributed to the following individuals: (i) the first users to supply liquidity. (ii) A weighted distribution based on the value of the given liquidity. (iii) The distribution of participants at random. These RN tokens will be granted at random to participants in the community that supply liquidity during the events.

- ***IDO***: Members of the community can purchase RN tokens through the RaumFi token IDO event. The IDO will take place about one month following the introduction of the RaumFi mainnet. During the IDO event, members can purchase RN tokens using ETH/USDC/USDT.

- ***Airdrop***: The airdrop event will take place following the conclusion of the IDO event. RaumFi community members with roles or those who have been members of Raum Network's Guild on Guild.xyz will be eligible for the airdrop. At the end of the IDO, we will take a snapshot of all RaumFi guild members and distribute airdropped RN tokens equally depending on the roles.

- ***Private Sale, Seed Round***: These tokens will be provided to early Raum Network investors. The maximum token supply ratio for early investors is set at 10%. All remaining tokens will be sent to the IDO, airdrop, and RaumFi partners.

- ***Liquidity Mining***: Following the "Initial Liquidity Rewards Event," we will begin long-term liquidity mining efforts. A share of RN tokens will be assigned to appropriate trading pools on a daily basis. You can earn RN tokens by supplying constant liquidity to these pools.

- ***Yield Farming***: Following the introduction of the RaumFi mainnet, you may lock and stake RN tokens on the RaumFi platform to receive a fixed APR return. Once your tokens have been unlocked, you will get staking incentives.

Token Allocation & Vesting Period

- Founding Team 15%
- Raum Development Fund 15%
- Airdrop 5%
- Private, Seed Round 10%
- Public Investment 10%
- Raum Ecosystem Fund 5%
- Staking Rewards 40%

Allocation	Token Amount	Vesting
Founding Team, Developers, Advisors	15%	Locked for 36 Months, Linear unlock over 18 Months
Raum Development Fund	15%	Unlocked
Raum Ecosystem Fund	5%	Unlocked, Divided (Pool & Marketing)
Private, Seed Round	10%	10% Unlocked + Remaining linear unlock over 18 Months
Public Investment,IDO	10%	Unlocked
Airdrop	5%	Unlocked
Staking Rewards	40%	Linear Unlock over 60 Months

Conclusion

The RN is critical to the Raum Network ecosystem, a decentralised exchange built on the revolutionary StarkNet & Polygon blockchains. As a governance token, RN allows its holders can participate in platform governance, earn platform income, and engage in yield farming and liquidity mining operations. With a fixed quantity of 500 million RN tokens and a token burn mechanism, RN is intended to promote consistent value growth and encourage long-term holding.

To distribute RN tokens and stimulate community interaction, the RaumFi platform hosts a range of token events, including the first liquidity rewards event, IDO, airdrops, private sales, and seed rounds. Members of the Raum Network community can benefit from the growth and success of the Raum Network ecosystem by actively engaging in these events while contributing liquidity to the platform.

As StrakNet continues to develop and expand its blockchain technology, with an emphasis on speed and security, RaumFi's potential as a premier decentralised exchange grows. The RN token will remain at the foundation of the RaumFi platform, empowering its users and creating the future of decentralised finance.
